Add Image Exchange to your HIE service portfolio with Express Connect

eHealth Express Connect Image Exchange connects community image providers with your HIE quickly and with no hardware required. In a few short weeks, radiologists, cardiologists, referring physicians, and other key care providers across the community will be accessing the medical images they need from all connected locations with a single click. Plus, the images are accessible within a unified viewing environment, in full diagnostic quality, when and where needed. The monthly subscription is less than the cost to burn and ship 25 images to CD!

eHealth Express Connect Image Exchange Features

Real-Time Collaboration

HIE Providers can collaborate with other providers in real time with a single click from the eHealthViewer by initiating a screen sharing consultation session.

Community-Wide Imaging Worklist

View and compare imaging studies from different locations. Radiologists, cardiologists, as well as other "image intensive" HIE users can sort and view one or more imaging studies from different imaging provider locations in a common eHealthViewer viewing session.

Transfer-to-PACS

Transfer external imaging studies directly to a local PACS. Radiologists, cardiologists, and other clinicians often need to make prior imaging studies accessible from their local PACS in order to properly diagnose and treat complex conditions. Image Exchange accomplishes this transfer without relying on physical media, all from the HIE user interface.

Emergent Workflow

Share emergent imaging studies with users across the community. Imaging providers can initiate real-time, life-saving imaging consultations with specialists. This includes situations such as stroke or trauma, when a quick second opinion is needed, a specialist is not available, or in preparation for transferring a critical emergency patient to an advanced care facility.

Automated Imaging Workflow

Automatically identify and retrieve external images from every connected facility across the community. Images are delivered into a local PACS or imaging system in advance of when they are needed with no time and labor required. This solution eliminates virtually ALL manual steps required to obtain prior images, helping clinicians provide faster treatment.
